### Terminology – linear elasticity

- In the 17th century, the British physicist Robert Hooke\* defined the basic relation between stress and strain as "ut tensio, sic vis".
- The fundamental "linearizing" assumptions of linear elasticity are:
  - infinitesimal small strains or "small" deformations
  - linear relationships between the components of stress and strain
  - In the linear elastic region, constitutive material models are able to correlate strain to stress without the need to consider the history of stress and strain events a specific object or assembly has been subjected to.

### Terminology – linear viscoelasticity

- When a viscoelastic material is subjected to stress, instantaneous elastic strain takes place followed by delayed elastic strain.
- Following delayed elastic strain, viscous flow can often be observed for adhesives with low crosslinking density.
- In linear viscoelasticity, the creep and the relaxation function are interrelated and each would permit the derivation of the viscoelastic constitutive relation.

### Terminology – non-linear viscoelasticity

- In practice, polymers and adhesive joints are often being used under service conditions exceeding the limitations of linear viscoelasticity.
- Indications for non-linear viscoelastic properties include changes of creep compliance for different stress levels and that the mechanical behavior depends on the sequence in which previous mechanical incidents have occurred.

Practical applications linear viscoelastic DMTA

- Results of DMTA-experiments using bulk specimen:
  - Storage modulus, loss modulus, tangent  $\delta$

# Theoretical background of DMTA

- Input: Stress  $\sigma(t) = \sin(\omega t)$
- Output: Strain  $\varepsilon(t) = \sin(\omega t + \delta)$

# Issues related to linear viscoelastic DMTA

 Caution should be exercised to avoid violation of the limits of linear viscoelasticity

fera 13-15 April 2015

Afera Technical Seminar 2015, Brussels

14

# Issues related to linear viscoelastic DMTA

- Reason for deviation from linear viscoelasticity:
  - Strain-induced non-isotropic material properties
  - Non-uniform stress field due to interfacial constrains

Afera Technical Seminar 2015, Brussels

 The concept of hysteresis analysis

### Non-linear viscoelastic analysis

Characteristic features of a hysteresis loop:

- $\sigma_o$  = maximum stress
- $\sigma_m$  = mean load
- $\sigma_u = \text{minimum stress}$
- $\sigma_a$  = stress amplitude
- $\varepsilon_o$  = maximum strain
- $\varepsilon_m$  = mean strain
- $\varepsilon_u$  = minimum strain
  - $\varepsilon_a$  = strain amplitude

#### Hysteresis features

 Storage energy and loss energy are calculated by integration

#### Viscoelastic parameters

Loss- and storage energy:  

$$W_L = \oint \sigma d\varepsilon = \pi \sigma_a \varepsilon_a \sin \delta$$
  
 $W_S = \int_{\varepsilon_u}^{\varepsilon_o} (\sigma_{mk} - \sigma_m) d\varepsilon = 2 \left(\frac{1}{2} \sigma_a \varepsilon_a \cos \delta\right)$ 

Lehr's damping ratio:

$$\Lambda = \frac{W_L}{W_S} = \frac{\pi \sigma_a \varepsilon_a \sin \delta}{\sigma_a \varepsilon_a \cos \delta}$$

## Viscoelastic response to perpendicular stress

- Creep caused by mean static stress
- Change in shape of hysteresis

## Linear vs. non linear viscoelastic analysis

 No apparent difference in storage energy in the early stage of the experiment

-specific storage energy (calculated by linear viscoelastic analysis)

-specific storage energy (calculated by hysteresis analysis)

#### Summary

• Dynamic mechanical analysis can be applied to adhesively bonded assemblies.

Afera Technical Seminar 2015, Brussels

27

### Summary

- Dynamic mechanical analysis can be applied to adhesively bonded assemblies.
- Fatigue resistant compliance / loss factor balance is a performance criterion.

Afera Technical Seminar 2015, Brussels

28

### Summary

- Dynamic mechanical analysis can be applied to adhesively bonded assemblies.
- Fatigue resistant compliance / loss factor balance is a performance criterion.
- Deviation from linear viscoelasticity may be indicative for failure due to creep and fatigue.
